All of the Tags used on my Webpage

<style> I used this tag to make my chart stand out more, giving it a solid black border that was 1 pixel in width.

<title> This tag was used to label the name of the tab used in your browser. This allows easy referencing when using your computer to identify what tab you will be choosing.

<Body style="background-color:powderblue;"> This tag allowed me to change the background color of the my site. The powder blue color chosen gives my webpage a nice touch that doesn't put as much strain on the eyes.

<h1> The tag h1 allowed me to create a header for my webpage. I chose the 1 to give it the largest font on the page to allow the name of my page to stand out.

**** ul allows for an unordered list to be used when labeling the shortcuts used for my webpage.

**** This tag allowed me to bold the topic of the list that I was creating. I used this tag for the title to stand out from the list.

**** To create bullet points for my course topic shortcut page, I used the tag

**** This tag allowed me to place a hyperlink on my own webpage to where the "Science Final Notes" portion of the site begins. This creates finding different sections much easier than scrolling.

<ol type="I"> This tag was used to create an ordered list that used roman numerals.

<b id="SF"> This tag was associated with the tag. This was used to let the href tag know where to take the user when the hyperlink was clicked on.

<i> The i tag is used to italicize a word or phrase. In my case, I used this tag to italicize the list of requirements that needed to be known for my Science Final Exam.

**
** This tag was used to make a break in the webpage and to space out the information. I used this tag multiple times to space my webpage out a little bit.

<h2> The h2 tag is a header tag, but displays a smaller font size than the <h1> tag. I used this for categories of different topics. They are important, but not as important as the title where I used <h1>

<table style="background-color:green"> This tag was used to change the background color of my table to green. I used this to make the table stand out apart from everything else.

<tr> This tag is used to define a row in the table. I used this tag multiple times when creating my unit conversion graph.

<th> This defines a header of a table. I used it when placing the different units of measurement.

<td> This tag defines each cell used in the table. There were the answers to the unit conversions inside of my own table.

<sup> I used this tag when I needed to include superscripts inside of the unit conversion table. This allowed me to show the powers of numbers.

<div align="center"> this tag was used to center the photo used on my webpage. This made my photo looks much nicer sitting in the middle of the screen compared to the left or right.

**** This tag allowed the image I chose to be shown on screen.

<p> The p tag labeled a paragraph of text. This was used to break apart different amounts of text and made the text look much nicer with it being spread out.

<button> The button tag was used to create a button on screen that also included a link to an informational page used in my studying tools. I used this button to make it easier for the user to find the link to the webpage included.

**** Font is a tag used for changing the elements of font. In my case, I changed the font color for each step of conducting experimental research to distinguish the different steps used.
